

## LVC 1 - Glossary of Notations

$\mathbf{X}_i$  = Vector containing values of input features corresponding to  $i^{th}$  record, where  $i$  ranges from 1 to  $n$

$Y_i$  = Value of output variable corresponding to  $i^{th}$  record

$X_i$  =  $i^{th}$  component of a vector  $\mathbf{X}$

$\theta$  = The unknown parameter vector

$\in$  = Belongs to

$R^m$  = A set of  $m$  real numbers

$P^\theta$  = The distribution of the parameter  $\theta$

$\hat{\theta}$  = The estimator to estimate  $\theta$

$g$  = The function of input features that determines the value of  $\theta$

$E$  = Expected value or average

$\neq$  = Not equal to

$\theta^*$  = True quantity or true value of  $\theta$

$g^*(X)$  = Actual value of  $g(X)$

$E[Y|X]$  = Expected value of  $Y$  given  $X$

$n$  = Number of records

$i$  = The iterator

$\Sigma$  = The summation

$\sum_{i=1}^n x_i$  = Summation of  $x_i$  from  $i$  equals 1 to  $n$

$\theta^T$  = Transpose of the vector  $\theta$

$m$  = Number of features

$\frac{\partial H}{\partial \theta}$  = Partial derivative of  $H$  with respect to  $\theta$ . It is also represented as  $\nabla H(\theta)$

$P(Y|X)$  = Probability of  $Y$  given  $X$

$\Pi$  = The product

$\prod_{i=1}^n x_i$  = Product of  $x_i$  from  $i$  equals 1 to  $n$

$\sigma$  = Standard deviation

$RSS$  = Residual sum of squares

$TSS$  = Total sum of squares

$R^2$  = R-squared, i.e., the fraction of variation in target variable that has been explained by the features

$\bar{Y}$  = Predicted output label if no regression is deployed i.e. mean of all true quantities

$var(x)$  = Variance of the quantity  $x$

$cov(a, b)$  = covariance of the quantities  $a$  and  $b$

$W_i$  = Residual term in the linear regression equation

$N(\theta_j^*, \sigma_j^2)$  = Normal distribution with mean  $\theta_j^*$  and variance  $\sigma_j^2$

$m \ll n$  =  $m$  is very less than  $n$

$se(\hat{\theta}_j)$  = Standard error of  $\hat{\theta}_j$

$CI$  = Confidence interval

$\approx$  = Approximately equal to

$P(\theta_j^* \in CI)$  = Probability of  $\theta_j^*$  belonging to the confidence interval  $CI$
